Julius Bär

BREAK THE SILO

How we built a decentralised control plane for service orchestration

Voxxed Days Zurich 2026

By Eros Taborelli – Principal Engineer & Software Architect at Julius Baer

WHY?

Context

Internal Developer Platform

Focused on Development

- 800+ engineers
- hundreds of applications
- Self-Service

Where we come from

The ‘traditional’ way of ordering infrastructure services

An engineer

Makes an order on a portal

And receives a resource
(example: VM)

Why it works

Benefits of a UI

- Filling a form is a normal, mundane task
- Immediate validation and visual feedback
- Some products and services come with a portal by default

Shortcomings

Hidden costs of a UI

- Day 2 operations must be implemented
- No comparison between environments
- Repeatability/Replicability

Where we come from

What about higher (test, staging, uat, prod) environments?

Split Responsibilities

Multiple teams involved, unclear ownership for the full process

Context

Internal Developer Platform

Focused on Development

- 800+ engineers
- hundreds of applications
- Self-Service

Context

Internal DevOps Platform

Streamlined Experience

- from DEV to PRD
- Self-Service remains

Our goals

Standardisation

Consistent experience when consuming infrastructure

Operational excellence

Actively promote the usage of Infra-as-Code

Ownership

Infrastructure Teams to drive the offering to end customers

WHY?

Our goals

Standardisation

Consistent experience when consuming infrastructure

- Familiar APIs with common patterns: Service Catalog
- No key differences when working with a database, a Kafka topic, or an object storage

Operational excellence

Actively promote the usage of Infra-as-Code

- Goodbye ClickOps
- Repeatable Infrastructure
- Built-In audit, diff, and day2 operations
- Apply Software Development best practices to infrastructure

Ownership

Infrastructure Teams to drive the offering to end customers

- Reduce dependencies
- End-to-End experience owned by the infrastructure teams, regardless of organizational structures
- More direct customer feedback

WELCOME: FLEET COMMANDER

Fleet commander

High level architecture

Goals achieved?

- ✓ Operational Excellence: GitOps / X-as-Code
- ✓ Standardization: Service Catalog
- ? Ownership: Decentralized Architecture and Responsibilities

KUBERNETES

+

CROSSPLANE

=

FLEET COMMANDER

WHY?

Operator pattern

Control loop on custom resources

Crossplane providers

Operators for external resources

Examples

- provider-azure
- provider-aws
- provider-gcp
- provider-confluent
- provider-kubernetes
- provider-vault

Crossplane composition

Harness the power of custom resource definitions

Composite resource definition

- Define the **Public API** of the Composition.
- When the Composition is deployed, Crossplane creates a standard Kubernetes **Custom Resource Definition**.

Function

- The implementation of the composition.
- Handles the CR and **decompose to one or multiple Kubernetes resources.**
- (hint: including resources defined by Crossplane providers and other compositions)

Fleet commander

Shared responsibility model

SDK

What fleet commander offers for easier onboarding

Fleet commander framework

- Golang: type safety, XRD generation, sustainable long-term
- Utility functions
  - provider-kubernetes wrapper (more later)
  - labels & annotations
  - unit testing
- Generic Helm chart (unit configuration)
- Build system

Goals achieved?

- ✓ Operational Excellence: GitOps / X-as-Code
- ✓ Standardization: Service Catalog
- ✓ Ownership: Decentralized Architecture and Responsibilities

BUT HOW DOES IT WORK?

Example

Provision a generic resource

*: wrapped for the k8s provider

```yaml
apiVersion: kubernetes.crossplane.io/v1alpha2
kind: Object
spec:
  forProvider:
    apiVersion: internal.platform.org/v1alpha1
    kind: CloudDatabase
    spec:
      readReplicas: 2
      location: ch-alps-1
      maintenance: Sunday
  providerConfigRef:
    name: dbunit
```

Repositories

Provisioned with pre-defined name and structure (Convention over Configuration), simplifying the parameters needed to deploy resources

```yaml
apiVersion: platform.org/v1alpha1
kind: CloudDatabase
metadata:
  name: db1
spec:
  readReplicas: 2
  location: ch-alps-1
  maintenance: Sunday
```

DEMO TIME

github.com/erost/vdz26-demo-fleet-commander

CHALLENGES

Data exchange

Solve dependencies between units (example)

Lifecycle

How to handle Crossplane updates in a distributed environment

Crossplane versions

- Crossplane runtime compatibility
- Crossplane libraries compatibility
- Fleet Commander Framework compatibility

Providers' requirements

- Providers have different Crossplane version requirements
- Different providers may have conflicting requirements

Onboarding costs

Steep learning curve

Learn Kubernetes concepts

- CRDs
- Operators

Learn Crossplane

- Providers
- Compositions
- Functions

Get familiar with Fleet Commander

- Architecture
- Framework
- Golang

Operate Unit

- Kubernetes
- Dependencies
- Maintenance

Q&A

THANK YOU!

github.com/juliusbaer/conferences

eros.taborelli@juliusbaer.com

Fleet Commander building blocks

Crossplane

Main project and releases

https://github.com/crossplane/crossplane

Develop compositions using Go

https://github.com/crossplane/function-sdk-go

Kubernetes Provider

Deploy and Manage arbitrary Kubernetes objects on different clusters (commander to unit)https://github.com/crossplane-contrib/provider-kubernetes

two Kubernetes

commander

- crossplane
- provider-kubernetes
  - configure unit credentials

- write public composition
  - decomposes into a kubernetes object
  - kubernetes object wraps internal composition custom resource
  - reference the unit configuration to delegate

- apply custom resource

unit

- crossplane
- desired providers

- write internal composition
  - decomposes into provider custom resources

- it appears here
